**Comment:**

I do not have comments on the content of the above referenced specification change, however, I did notice that products to be listed on the QPL are identified by asterisks. As we had mentioned in some earlier emails on the QPL there is reference made to "Other References". I noticed that Section 400 is not referenced on the following QPL Numbers: S562, S932, and S975.

**Response:** Duplicity of cross references is not necessary in this case. The main usage section speaking to contractors is this section. The other sections are providing supplemental information to this section. In addition, it would be impossible to cross reference every section that references S562, S932, and S975 as a supplemental section and maintain all the future changes.

**Comment:**

Why is this requirement being removed?  
SUBARTICLE 400-2.6.6 (of the Supplemental Specifications) is deleted.

~~**400-15.2.6.6 Material Tests and Certification:** Before any portion of any shipment of finish coating is applied on the project, furnish the Engineer with a certificate from the manufacturer attesting that the commercial product furnished conforms to the same formula as that previously subjected to the tests specified in Section 975. In addition, submit the following product analysis, obtained from the manufacturer, for each batch of the material used:  
(a) Weight per gallon.  
(b) Consistency (Krebs Units).  
(c) Weight percent pigment.  
(d) Weight percent vehicle solids.  
(e) Infra red spectra of vehicle solution.~~

**Response:** As was described in the Origination form, a series of meetings were held in 2008 with Construction and each affected FDOT office representatives to identify the certifications included in the Specifications that were redundant to the QPL and unnecessary for documentation. This product category was identified as redundant. Therefore the supplementary material tests and certification are being removed.
