I would caution against using this in lieu of temp concrete barrier wall when positive protection is needed.

D5 Construction

Comments: (12-11-14)

Regarding the addition of sheeting requirement for longitudinal channelizing devices and inclusion of a minimum ballast requirement, is the likelihood that the requirement of the 100 pound minimum internal ballast can, will, or should be verified by staff in the field. Which I am not sure is entirely feasible/reasonable. The previous language requiring the contractor to determine the proper weight to maintain position puts the liability and onus on them.
