Concrete Structures- There seems to be a variety of descriptions of the "Steel Reinforcement for concrete structures in this revision". Recommend that one terminology is used to describe that and consistently used throughout the document to avoid confusion. I recommend using "Reinforcing steel for Concrete". If your intent is to combine the terms to apply to steel or FRP then it would be better to use the appropriate term for each material type and not generalize.

Response:

Thank you for your comment. We will consider this for future revisions, as this would have been an effort throughout the Spec book to clean up terminology including the words reinforcing, reinforcement, rebar, bar, etc.
