Design of Shallow Foundations on Florida Limestone

Miami

Suwannee
Table 7. Presumed preliminary design bearing pressure (Canadian Geotechnical Society, 2006).

<table>
<thead>
<tr>
<th>Group</th>
<th>Types and conditions of rocks</th>
<th>Strength of rock material</th>
<th>Preliminary design bearing pressure (5) kPa (ksf)</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rocks</td>
<td>Massive igneous and metamorphic rocks (granite, diorite, basalt, gneiss) in sound condition (2)</td>
<td>High-very high</td>
<td>10,000 (200)</td>
<td>These values are based on the assumption that the foundations are carried down to unweathered rock.</td>
</tr>
<tr>
<td></td>
<td>Foliated metamorphic rocks (slate, schist) in sound condition (1)</td>
<td>Medium-high</td>
<td>3,000 (60)</td>
<td>Not applicable</td>
</tr>
<tr>
<td></td>
<td>Sedimentary rocks: cemented shale, siltstone, sandstone, limestone without cavities, thoroughly cemented in conglomerates, all in sound condition (1)(2)</td>
<td>Medium-high</td>
<td>1,000–4,000 (20–80)</td>
<td>Not applicable</td>
</tr>
<tr>
<td></td>
<td>Compaction shale and other argillaceous rocks in sound condition (2)(4)</td>
<td>Low-medium</td>
<td>500–1,000 (10–20)</td>
<td>Not applicable</td>
</tr>
<tr>
<td></td>
<td>Broken rocks of any kind with moderately close spacing of discontinuities (0.3 m [11.8 in] or greater), except argillaceous rocks (shale), limestone, sandstone, shale with closely spaced bedding</td>
<td>Not applicable</td>
<td>(See note 3)</td>
<td>Not applicable</td>
</tr>
<tr>
<td></td>
<td>Heavily shattered or weathered rocks</td>
<td>Not applicable</td>
<td>(See note 3)</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

Notes:
1. The above values for sedimentary or foliated rocks apply where the strata or the foliation are level or nearly so, and, then, only if the area has ample lateral support. Tilted strata and their relation to nearby slopes or excavations should be assessed by a person knowledgeable in this field of work.
2. Sound rock conditions allow minor cracks at spacing not closer than 1 m (39.37 in).
3. To be assessed by examination in-situ, including test loading if necessary.
4. These rocks are apt to swell on release of stress, and on exposure to water they are apt to soften and swell.
5. The above values are preliminary estimates only and may need to be adjusted upwards or downwards in a specific case. No consideration has been made for the depth of embedment of the foundation. Reference should be made to other
Possible Failure Modes (NCHRP 651)

Figure 36. Modes of failure of a footing on rock including development of failure through crack propagation and crushing beneath the footing (a-c), punching through collapse of voids (d), and shear failure (e) (based on Goodman, 1989).

Figure 37. Analysis of bearing capacity on rock (based on Goodman, 1989).
Bearing Capacity (NCHRP 651)

Hoek and Brown

\[ \sigma_1 = \sigma_3 + \left( m q_u \sigma_3 + s q_u^2 \right)^{0.5} \]  

where

- \( \sigma_1 \): major principal effective stress,
- \( \sigma_3 \): minor principal effective stress,
- \( q_u \): uniaxial compressive strength of the intact rock.

\( s \) and \( m \) are empirically determined strength parameters for the rock mass, which are to some degree analogous to \( c \) and \( \phi_r \) of the Mohr-Coulomb failure criterion.

Figure 39. Lower bound solution for bearing capacity (Carter and Kulhawy, 1988).

\[ q_{ult} = \left( \sqrt{s} + \left( m \sqrt{s} + s \right)^{0.5} \right) q_u \]
Scope of Work

■ Task 1 – Acquire and Setup Triaxial Testing Equipment for Florida Limestone
  ■ Cell Pressures up to 1500 psi, Top Load 40 kips
■ Task 2 – Field Acquisition of Florida Limestone and IGM
  ■ Obtain hundreds of specimen (2” to 4”) in top 10 to 20ft
    ➢ Either through district drillers (example district3), SMO (Orlando to Jacksonville) or by contract
    ➢ Record RQD, Recovery and Transport to Gainesville for Testing
■ Task 3 – Perform qu, qt, and triaxial testing on specimens
  ➢ Strain Controlled Testing (Possible Strain Softening)
  ➢ Monitor Stress, Strain, and Pore Pressure
■ Task 4 – Develop Stress-Strain and Strength Models for Florida Limestone (Hoek & Brown or other)
■ Task 5 – Develop 2 layer Bearing model for Limestone
Triaxial Testing of Limestone

1500 psi
Cell Pressure

40,000 Lbs.
Load Capacity

Monitor Sample
Stress, Strain & Pore Pressure
Task 2: Collection of Limestone Cores
Task 3&4 Testing and Models

- Conventional Unconfined and split tension
- Triaxial Compression Loading
  - 300, 800 and 1200 psi confining pressures
- Triaxial Extension Loading
- Strain Controlled (Strain Softening)
- Develop Stress-Strain & Strength Envelope for Limestone (Hoek & Brown?)
Task 5 Numerical Modeling

- Employ Stress-Strain-strength in FEM code
- Validate with Triaxial Data (Strength, softening, etc.)
- Model 2 layer boundary problem
- Develop Bearing Capacity Equation
  \[ q_u = ? \]
Thank You!
