BEAM CURVATURE AND BUILD-UP NOTES

The build-up values given in the table are based on theoretical beam cambers. The Contractor shall monitor beam cambers for the purpose of predicting camber values at the time of the deck pour. If the predicted cambers based on field measurements differ more than 1/4" from the theoretical "Net Beam Camber @ 200 Days" shown in the table, modify the build-up dimensions as required. When the measured beam cambers create a conflict with the bottom mat of deck steel, notify the Engineer a minimum of 2 days prior to casting.

DIM "A" includes the weight of the Stay-In-Place Formwork.

INSTRUCTIONS TO DESIGNER:

Although not shown here in the Diagrams or Notes, the effect of Horizontal Curvature, when present, needs to be considered for the Build-up Calculations.
